Since their introduction, the Planmeca Proline series of panoramic X-ray units sets standards for high-quality, practical, and user-friendly extraoral dental X-ray units. Innovative technical solutions, easy patient positioning, and exceptionally clear radiographs have made Planmeca Proline X-ray units incredibly popular among dental professionals. Today, there are more than 30,000 units installed all over the world.
Planmeca Proline XC provides well-proven panoramic imaging capabilities and ease of use for any dental practice. With Planmeca Proline XC, radiographic examinations of all kinds are extremely rapid and easy to perform.

Here are the main reasons:

- Open and easy patient access
- Comfortable and stable patient supports
- Side entry and open view for practical and precise patient positioning
- Allocated adjustments for patient positioning
- Triple laser beam system for accurate alignment of reference anatomical landmarks
- The graphical user interface (GUI) for intuitive selection of exposure program and parameters

- With state-of-the-art direct digital imaging the image is available for diagnosis immediately after exposure. Planmeca Proline XC is available in two versions: film-based and fully digital. The film-based unit can be digitised at a later time.

In order to achieve accurate and undistorted panoramic radiographs, the form of the unit focal layer must follow the actual patient anatomy. In Planmeca Proline XC, the form of the focal layer follows the scientifically defined shape of human dental arch and jaw, which results in panoramic radiographs with clearly superior clinical quality.

The unit’s imaging geometry efficiently eliminates shadows and ghost images caused by objects outside the image layer, which significantly improves the diagnostic value of the radiograph.

Planmeca Proline XC is available in two versions: film-based and fully digital. The film-based unit can be digitised at a later time. In order to achieve accurate and undistorted panoramic radiographs, the form of the unit focal layer must follow the actual patient anatomy. In Planmeca Proline XC, the form of the focal layer follows the scientifically defined shape of human dental arch and jaw, which results in panoramic radiographs with clearly superior clinical quality.

The unit’s imaging geometry efficiently eliminates shadows and ghost images caused by objects outside the image layer, which significantly improves the diagnostic value of the radiograph.*

The Planmeca Proline XC unit is delivered completely assembled, in one package, and ready-to-mount. Therefore the installation is quick and straightforward. All you have to do is to fix the unit on a wall, or alternatively on a free-standing base, and it is ready for immediate use. The unit requires no adjustments nor assembling, which is not the case with most X-ray units by other manufacturers.

* Modified from DeSantis and Mobeen, (Dental Imaging in the Digital Age, ed. 3, Quintessence Publishing Co., Inc., 2004).
In Planmeca Proline XC, the side entry and the open positioning concept minimise errors caused by incorrect patient positioning, one of the most frequent reasons for failed radiographs. The operator can monitor the patient freely from the front, back, and side, making patient positioning quick, precise, and easy.

A triple laser beam system accurately indicates the correct anatomical positioning points. Here is how it works:

- The midsagittal plane positioning beam shows the correct sideways alignment of the patient’s head. The image will be symmetric and undistorted in left-right direction.
- The Frankfort horizontal plane positioning beam shows the correct forward tilt of the patient’s head. On the image, the teeth will line up straight.
- The focal layer positioning beam indicates the focal layer’s position in the incisor region, helping in positioning the patient fully inside the focal layer for sharp and clear images.

Side entry allows easy access to the X-ray unit for all types of patients. The exposure can be performed with a standing patient – the recommended way for short procedures – or a seated patient. It is also possible to take an exposure of a patient seated on a wheelchair or a hospital bed with upright lifted backrest.

Planmeca Proline XC has the unique Automatic Gain Control (AGC), which optimises the sensitivity of the digital sensor to produce optimum image quality from each individual.

The Planmeca Proline XC film unit can be equipped with the optional Automatic Exposure Control (AEC), which measures the patient’s radiation transparency and correctly adjusts exposure values to achieve the desired film darkness and contrast.

Planmeca Proline XC, the Sirius program has a specially designed image layer, which results in a radiograph with a clear view of the maxillary sinuses. The automatic Double TMJ program produces a lateral view of open and closed temporomandibular joints on one radiograph. The imaging procedure is straightforward, and the radiograph provides easy diagnosis of the TMJ condition in one view.

The True Profile TMJ program is an optional program that enables you to adjust optimally the TMJ imaging angles for each individual patient. It also produces specific perpendicular radiographic projections of the condyles.

In Planmeca Proline XC, the Sinus program has a specially designed image layer, which results in a radiograph with a clear view of the maxillary sinuses.

Planmeca Proline XC allows the selection of the correct exposure format, minimising the radiation dose for all types of patients and diagnostic purposes.

- The Pediatric program automatically selects a reduced area for the exposure. This results in 20% lower patient dosage, without loss of diagnostic information.
- The Vertical Segmenting program, the exposed area can be limited only to the area of diagnostic interest. A simple selection on the main display, and the patient dose can be reduced by up to 80% compared to a full area panoramic exposure. This is highly advantageous as radiation hygiene in cases where a follow-up image is needed of a limited part of the jaw.*

When you select the cephalometric imaging mode, the unit will automatically align itself for taking cephalometric exposures and select a corresponding collimator. The functional and easy-to-use head positioner guarantees accurate positioning for all cephalometric projections. The carbon fibre ear posts and nasal positioner are extremely durable, hygienic, and fully transparent to radiation.

The digital cephalostat scans the patient’s head horizontally with a narrow X-ray beam. This results in lower effective patient dose than in film-based cephalometry. Planmeca’s unique design allows exceptional flexibility in image formats, with field sizes of up to 27 x 23 cm (11 x 9 in.).

With the digital imaging technique and the wide dynamic range of the digital sensor, soft tissue can be made visible by the Planmeca Romexis imaging software. This means that images can be viewed with or without the filter applied.

Used with the film-based unit, Planmeca Proline Cephalostat CM provides motorised aperture and soft tissue filter selection from the main display. A cephalometric system, be it film-based or digital, can easily be added to a Planmeca Proline XC unit any time in the future. To fit the user’s preferences, the unit can be equipped with one movable sensor or with two fixed sensors.
Technical specifications

Planmeca Proline XC

Planmeca Proline XC with film-based cephalostat

Planmeca Proline XC with digital cephalostat

Generator
Constant potential, microprocessor controlled, operating frequency 80 kHz

X-ray tube
D-052SB

Focal spot size
0.5 x 0.5 mm according to IEC 336

Total filtration
2.5 mm Al

Anode voltage
60–80 kV

Anode current
≤12 mA DC

Exposure time
Pan 2.5–18 s
Ceph 0.2–23 s

Film size
Pan 15 x 30 cm
12.5 x 30 cm
Ceph 18 x 24 cm
8 x 10 in.

Cassette
Flat

SID
Pan 480 mm (19 in.)
Ceph 163–170 cm (64–67 in.)

Magnification
Pan constant 1.2
Ceph 1.08–1.13

Line voltage
100/117/220–230/240 V, 50 or 60 Hz

Regulation
Automatic, ±10%

Line current
8–16 A

Colour
White (RAL 9016)

Planmeca Romexis software

Planmeca Romexis is a complete dental imaging software, including all dental imaging modalities: intraoral, panoramic, cephalometric, 3D imaging, dental tomography as well as full-frame video and digital imaging. With a complete set of tools for image viewing, enhancement, measurements, and annotations, Planmeca Romexis also improves the diagnostic value of radiographic printing, image import and export, and DICOM functionalities are also included.

Planmeca Romexis platform fully integrates digital imaging with the patient’s electronic chart. The system provides direct image capture from Planmeca’s X-ray equipment, and interfaces with the “party devices” via TWAIN. Together with Planmeca Romexis, Planmeca’s X-ray equipment, Planmeca Romexis provides a unique solution especially useful for teaching environment, the X-ray image capture is inhibited until the supervisor has approved the student’s image capture request.

Planmeca Romexis computer recommendations

Planmeca Romexis client work station

Processor 1 GHz
RAM 1 GB
Hard disk space 40 GB
Monitor 1280 x 1024
Hardware CD-RW or DVD-RW drive
Backup medium None necessary
Operating system Windows XP
Other Java platform (Java Virtual Machine 1.6 or later)

Planmeca Romexis server

Processor 2 GHz
RAM 2 GB
Hard disk space 160 GB
Monitor 1280 x 1024
Hardware CD-RW or DVD-RW drive
Backup medium CAT or equivalent
Operating system Windows 2003 Server
Other Java platform (Java Virtual Machine 1.6 or later)

The disk space requirements are determined by digital images. Thus the space requirements vary, but a rough estimate is in the order of 1 MB per 2D X-ray image, 3–5 MB per extraoral image, depending on a variety of image specific factors, and 250 MB per 3D image.

It is recommended to use the same computer as an application server and as a database server. If Planmeca Romexis server computer is also used for client activities, the hardware should meet both client and server specifications.

These specifications are recommended minimum requirements. Not meeting them may lead to degraded performance.

DICOM compatibility

• Media Storage – saving images into removable DICOM media
• Print – printing images on film or paper with a DICOM media printer
• Storage – saving images into DICOM image archive
• Query/Retrieve – importing digital images from DICOM image archive
• Worklist – importing a patient list from DICOM patient management
• Storage Commitment – confirmation of a successful image storage

Planmeca Proline XC

Physical space requirements

Weight
Planmeca Proline XC Panoramic
109 kg
Planmeca Proline XC Panoramic with Autoprint
112 kg
Planmeca Proline XC with Cephalostat
126 kg

Planmeca Oy designs and manufactures a full line of high technology dental equipment, including dental care units, panoramic and intraoral X-ray units, and digital imaging products. Planmeca Oy, the parent company of the Finnish Planmeca Group, is strongly committed to R&D, and is the largest privately held company in the field.
